

podo user-manual

podo is a distortion and VCA based on the sunn((O))) beta-lead preamp, where the distortion stage is based on CMOS hex inverters (CD four-zero-six-nine).

It has a colour section to shape bass, mid and treble. there's a VCA on the output, plus an extra CD controllable feedback path with a send/return section.

BEWARE: podo is a self-conscious machine and can speak on its own.

red stripe matches the white silkscreen line.

power consumption: + sixty mA ;
 - sixty mA ;

depth: two point five cm;
